How to clean a whirlpool gold series oven

WARNING Burn Hazard Do not touch the oven during the Self-Cleaning cycle. Keep children away from oven during Failure to follow these instructions can result in burns. **IMPORTANT:** The health of some birds is extremely sensitive to the fumes given off during the Self-Cleaning cycle. Exposure to the fumes may result in death to certain birds. Always move birds to another closed and well-ventilated room. Self-clean the oven before it becomes heavily soiled. Heavy soil results in longer cleaning and more smoke. Keep the kitchen well-ventilated during the Self-Cleaning cycle to help get rid of heat, odors, and smoke. Do not block the oven vent(s) during the Self-Cleaning cycle. Air must be able to move freely. Depending on your model, see "Oven Vents" or "Oven Vents" section. Do not clean, rub, damage or move the oven door gasket. The door gasket is essential for a good seal. Prepare Oven: ■ Remove the broiler pan, grid, cookware and bakeware and, on some models, the temperature probe from the oven. ■ Remove oven racks to keep them shiny and easy to slide. See "General Cleaning" section for more information. ■ Remove any foil from the oven because it may burn or melt, damaging the oven. ■ Hand clean inside door edge and the 1½" (3.8 cm) area around the inside oven cavity frame, being certain not to move or bend the gasket. This area does not get hot enough during self-cleaning to remove soil. Do not let water, cleaner, etc., enter slots on door frame. Use a damp cloth to clean this area. ■ Wipe out any loose soil to reduce smoke and avoid damage. At high temperatures, foods react with porcelain. Staining, etching, pitting or faint white spots can result. This will not affect cooking performance. Prepare Cooktop: ■ Remove plastic items from the cooktop because they may melt. **IMPORTANT:** Oven temperature must be below 400°F (205°C) to program a clean cycle. Only 1 oven can be cleaned at a time. The Warm Zone element will not function during self clean. Both oven doors lock when either oven is being cleaned. 18 Self-Cleaning Cycle (on some models) How the Cycle Works **IMPORTANT:** The heating and cooling of porcelain on steel in the oven may result in discoloring, loss of gloss, hairline cracks and popping sounds. The Self-Cleaning cycle uses very high temperatures, burning soil to a powdery ash. The oven is preset for a 3 hour clean cycle; however, the time can be changed. Suggested clean times are 2 hours for light soil and between 3 hours and 4 hours for average to heavy soil. Once the oven has completely cooled, remove ash with a damp cloth. To avoid breaking the glass, do not apply a cool damp cloth to the inner door glass before it has completely cooled. The oven light will not work during the Self-Cleaning cycle. When "LOCK" shows in the display, the door cannot be opened. To avoid damage to the door, do not force the door open when "LOCK" is displayed. If an oven door is left open, "Door open clean cancelled" will appear in the display and a signal will beep. Close the door and press CLEAN. To Self-Clean: 1. Close the oven door. 2. Press STEAM/PRECISE CLEAN. "PRESS (*) FOR UPPER OVEN" will scroll in the upper oven text area and "PRESS () FOR LOWER OVEN" will scroll in the lower oven text area. 3. Press the Temp/Time "up" or "down" arrow pads to select the desired oven. "REMOVE RACKS" will scroll in the selected oven text area for 5 seconds, followed by "SELECT OPTION." In the lower oven text area, "PRESS (*) or () KEY" will scroll from right to left. 4. Press the Temp/Time "up" or "down" arrow pad until "PRECISE CLEAN" appears in the upper text display area, and "PUSH START" appears in the lower text display area. 5. Press START. "SELECT LEVEL" appears in the upper text display area. "PRESS (*) or () KEY" will scroll from right to left in the lower text area. 6. Press the Temp/Time "up" or "down" arrow pad until the desired cleaning level scrolls in the upper text display area and "PUSH START" scrolls in the lower text display area. 7. Press START. 8. "UNLOCK IN XXX" will scroll in the upper or lower text area (depending on oven selection). "LOCKING" will scroll until the door is locked. After the door is lock, "CLEAN UPPER" or "CLEAN LOWER" will scroll in the selected oven text area until the clean cycle is finished. When the self-clean cycle ends, "CLN COMPLETE" will scroll in the selected oven text area. After 5 seconds, "OVEN COOLING" will scroll in the display until the oven temperature falls below 500°F (260°C). "UNLOCKING" will be displayed until the oven door unlocks and the lock icon turns off. ^ ^ ^ Note: Allow the oven to cool to room temperature before using the clean cycle. If your oven cavity is above 200°F (93°C), "Oven Cooling" will appear in the display, and the Clean cycle will not be activated until the oven cavity cools down. Remove all racks and accessories from the oven cavity and wipe excess soil. Use a plastic scraper to remove easily removed soils. Pour 1¼ cups [14 oz (414 mL)] of distilled or filtered water onto the bottom of the oven open and close the oven door. **IMPORTANT:** Do not use chemicals or other additives with the water. Do not open the oven door during the Clean cycle. The water on the oven bottom is hot. Press AQUALIFT SELF CLEAN and then START on the oven control panel. Allow 40 minutes for cleaning and cool down. A beep will sound when the Clean cycle is complete. Press CANCEL at the end of the cycle. Cancel may be pressed at any time to stop the Clean cycle. Remove the residual water and loosened soils with a sponge or cloth immediately after the Clean cycle is complete. Much of the initial 1¼ cups [14 oz (414 mL)] of water will remain in the oven after the cycle is completed. If additional soils remain, leave a small amount of water in the oven bottom to assist with the cleaning. If any soils remain, remove them with a non-scratch scrubbing sponge or plastic scraper. Additional Clean cycles may be run to help remove the stubborn soils. **IMPORTANT:** Do not use oven cleaners. The use of chemicals, including commercial oven cleaners or metal scouring pads, may cause permanent damage to the porcelain surface of the oven interior. Make sure the range is level. This will ensure the bottom of the oven cavity is covered by water. Use distilled or filtered water. Tap water may leave mineral deposits on the oven bottom. Before removing the residual water and loosened soils at the end of the Clean cycle, insert a cloth or paper towel between the lower edge of the oven door and the front frame to keep water from spilling onto the front of the range and the floor. Nonabrasive scrub sponges or eraser style cleaning pads(without cleaners) can be useful for cleaning the oven cavity walls, oven door and oven bottom for difficult soils. For best results, moisten the pads and sponges before use. Run an additional Clean cycle for stubborn soils. **affresh®** Cooktop Cleaner may be used to clean the oven bottom, walls, and door when the oven has finished the clean cycle and returned to room temperature. If the **affresh®** Cooktop Cleaner is used, it is recommended to wipe out the cavity with distilled water as well. Additional Aqualift™ Technology Cleaning Kits are available. If you would like to download or view product literature for your appliance, please visit our Manuals and Literature page. **affresh®** cleaners are available at many retailers. Find one here. Was this article helpful? I bought a Whirlpool Aqualift Range. It was advertised as a self-cleaning oven on the Home Depot website. The cleaning feature did nothing at all except leave 1 1/2 cups water in the bottom of my oven for me to mop up. When I called Whirlpool to complain I was told this was how it worked and it was a "assisted clean technology"... meaning I have to get on my hands and knees at age 61 and scrub it out manually. Even the repair tech confirmed that the feature was not self-cleaning. Right now, neither Home Depot or Whirlpool will take responsibility for this horrible product. I am livid. Any advice on what I can do would be appreciated. I would not have bought this appliance if I had known it was not really self-cleaning... and I really feel both Home Depot and Whirlpool are thieves. There are a few universal "dreaded" jobs everyone hates to do—among the top-ranked, ironing their clothes and cleaning their oven. So, it's likely when you bought your last oven. You were really excited to see that it had a "self-cleaning" feature. Goodbye to the days of smelly cleaner fumes and back-breaking scrubbing, and hello to a sparkling clean oven with just the touch of a button. Not so fast! While oven manufacturers have tried to develop features that take the "work" out of housework, the self-cleaning component of many newer models can actually cause some serious problems with your appliance. Surprisingly, for every 10 jobs FIX Appliance CA technicians respond to, every four or fifth request is related to self-cleaning problems. We want to help you avoid major issues with your own oven, so let's examine the process and the potential concerns: What is a self-cleaning oven? A self-cleaning oven is a feature on many modern ovens that burns off cooking spills and splatters with an extremely high temperature (932 F° or 500 C°) to aid in cleaning. A cycle typically takes several hours to complete, and for safety measures, it automatically locks the oven door closed until it has sufficiently cooled. Self-cleaning ovens often cook more efficiently as they are manufactured with more housing insulation to withstand the high temperature needed during cleaning. How Self-Cleaning Ovens Work Most name-brand manufacturers offer a self-cleaning oven feature, including Blomberg, Bertazzoni, Bosch, DCS Fisher & Paykel, GE, Electrolux, Frigidaire, Fulgor Milano, Jenn-Air, KitchenAid, Kenmore, LG, Panasonic, Maytag, Viking, Whirlpool, Wolf, Samsung and more. Each has a variation of sidewall coatings that are made from heat- and acid-resistant porcelain enamel. As temperatures inside the oven increase, any leftover food particles will be burnt to ash. Step 1—Empty it out Before you start the cycle, make sure to remove everything inside the oven. Empty the racks, pots and pans, cookie sheets, aluminum foil or anything else that's being stored inside. There is no need to use any chemical oven cleaners on the internal surfaces. However, you may need to use a strong oven cleaner on racks when you wash them in the sink. Racks left inside the oven during the cleaning cycle will appear dull afterward. Vegetable oil is a good option to restore the sheen to the metal. Step 2—Lock her down Once the stove is empty, the locking door system can be activated. Although there is a manual locking mechanism, generally, you should use the automatic system that latches with an electric motor and switches. This mandatory latch is an important safety feature that prevents accidental injury and burns. Step 3—Press the button. Before you start the process, recognize that it will take approximately three to four hours to complete the cycle. Make sure never to use this feature when the home is unattended. The intense heat needed to burn off leftover food particles and grease can produce smoke that may set off your smoke detector. All heat elements will be activated during this phase, and the temperature inside your oven can reach more than 1292 F° or 700° C, much higher than is needed for cooking. You'll want to open a window slightly to cool the room and run an exhaust fan to reduce the amount of smoke and odours in the air. Step 4—Be patient A safety feature of the system uses a mechanical interlock to keep the oven door closed and locked until the temperature inside reaches approximately 572 F° or 300° C. This is set this way to prevent possible burn injuries, so the latch won't unlock until the oven has completed both the clean and cool-down phases. Once it reaches the right temperature, it will automatically unlock. Step 5—Wipe it down Even after the door unlocks, you'll want to wait a couple more hours for the oven to cool sufficiently to wipe down the inside. You'll need to remove the ash residue with a sponge or damp cloth. Areas around the seals and door edge will require a more thorough hand cleaning with hydrogen peroxide as they will not do this area. How often should it be run? There is conflicting information between manufacturers about how often the self-cleaning feature should be run. Some recommend running the cycle monthly to prevent heavy build-up, while others suggest limiting use to a maximum of six times per year. This is to save energy and appliance wear and tear. You should always follow the manufacturer's recommendations from your specific appliance. This is where things get a little challenging. Is it worth having a self-cleaning oven? Let's take a look at some of the pros: Convenience—obviously, the primary appeal of a self-cleaning oven is that you won't have to use harsh oven cleaners or scrub spills and burned on food by hand. You can spend three to four hours during the self-cleaning process to do other chores or something more enjoyable. Energy Savings—your oven is equipped with extra heavy insulation to help it achieve the high temps needed for cleaning. This means less heat loss during regular cooking and more efficient energy use. If you run the self-cleaning cycle immediately after cooking, the already high oven temperature will reduce the energy used to get it up to the maximum level needed. Cost—appliance manufacturers suggest the extra cost of purchasing a self-cleaning oven is offset by its convenience and time-saving attributes. They also indicate that the energy savings achieved during cooking (due to extra insulation) and no need to purchase pricey chemical cleaners also balance the initial expenditure. The big reveal. Now that we've examined exactly what self-cleaning ovens are designed to do let's really understand the negative impact and potential hazards associated with this feature. 1. Major Parts Damage The extremely high temperature required to run the self-cleaning cycle can significantly compromise major components of your oven. Locking mechanism Replacing door locking mechanism affected by self-cleaning feature. Oven repair service call from Barrie This is the assembly that is supposed to lock and unlock automatically after the cycle is complete. It's common for this to malfunction and gets stuck in the locked position. This will require a service call and part replacement. Thermostat Thermal fuses Brand new oven thermostat These safety features control the temperature settings for conventional cooking. They are positioned on top of the oven or the oven walls and can be damaged or "pop" from the high heat. This can lead to inaccurate temperature readings to undercook or overcook your food (a health hazard) or make the oven stop working entirely. This will also require professional oven repair. Electronic boards/Touch screen Burnt mainboard from Barrie oven repair service call Aka "the brain," these control units work together to make sure your oven responds to your orders. These components sit on top of the oven and can be affected by the intense heat generated from self-cleaning. You may see error codes, the oven may turn on and off at will, or everything may just shut down completely. These parts are costly to replace and will definitely require an appliance technician to correct them. Wires and contact terminals Back wall oven wires and mainboard connectors are affected by extreme temperatures of self-cleaning mode. A maze of wires and connectors distribute electricity to all parts of your stove. While they are covered with thermal insulation to protect them from the heat of normal cooking, the extreme and prolonged temperature needed for the self-cleaning mode may melt the insulation and damaged the wiring. Pinpointing the exact problem area could require numerous visits and significant troubleshooting. Miscellaneous interior components The Oven heating element broke in four places after running the self-cleaning mode several times. Oven repair Barrie service call Everything from the light bulbs and gas housings to thermal sensors to the enamel inside your oven could be damaged from the process. While these parts may not fail on the first use, continued applications will definitely compromise every part inside your oven. If your oven shows an error code during or soon after using the cleaning mode, it's likely related. Consult your owner's manual to identify the error code and contact FIX Appliances CA to schedule a quick-response service call. Here's a quick table of error codes for Whirlpool, Maytag, Frigidaire, Electrolux, GE (General Electric), Ikea and Kenmore range stoves: Errors – Locking mechanism Errors – Electronic Oven Controls (EOC) F5 – E1 F1 – E0 F5 – E2 F1 – E1 F5 – E3 F1 – E2 F5 – E4 F1 – E4 F5 – E5 F0 F5 – E6 F1 F9 F2 Errors – Locking mechanism Errors – Electronic Oven Controls (EOC) F9 F0 F10 F9 F13 Errors – Locking mechanism Errors – Electronic Oven Controls (EOC) FC FF or FFF F0 or F1 or F2 2. Dangerous Smoke, Odours and Carbon Monoxide Failure to remove bigger pieces of food debris or liquid from your oven before running the self-cleaning feature can lead to excessive smoke and foul odours. In addition, those pieces may not break down into ashes but bake on oven hardware. Sugary foods and spills can create enough smoke to set off fire alarms or cause eye and breathing issues. Worse yet, a study by the North Iowa Municipal Electric Cooperative Association discovered that carbon monoxide is produced when food residue is burned during the self-cleaning cycle. This poisonous gas is odourless, tasteless, and invisible. Carbon monoxide is responsible for thousands of injuries and deaths every year. You must open windows and run an exhaust fan to dissipate gas fumes during the cleaning process. Keep a working carbon monoxide detector in your home, as there is no way to eliminate carbon monoxide emissions when using this function. 3. Family Safety Children and pets can be at great risk of burns as the oven's exterior also gets extremely hot, so you should never leave kids or animals in the kitchen unattended while cleaning. Toxic fumes emanating from the smoke cloud can also be dangerous to anyone with asthma or respiratory diseases. The Teflon coating inside your oven can break down when exposed to high temperatures, and inhaling the fumes can lead to breathing issues, coughing, sweating, chills and flu-like symptoms. Animals, especially birds, are also at risk from smoke and fumes. Large amounts of oxygen are required to maintain a bird's flight muscles. The toxicity in the off-gasses can quickly permeate through the bird's body and even cause death. Ventilating the kitchen is not sufficient to protect your family or animals from breathing in harmful fumes. If you use the self-cleaning feature on your oven, make sure family members (including children) and animals are as far away from the room during the process. 4. Fire Hazard Last but certainly not least, the self-cleaning feature can present a fire hazard. Even if you've removed all the larger food particles, you'll likely have grease or cooking oil splatters and spills to burn off. With an inside temperature exceeding 500° C, and a flashpoint (the temperature at which items can self-combust without an ignition source) between 750 to 815°F° or between 400 to 435° C, your leftover pepperoni grease can start on fire. A word of advice: If your oven does catch on fire during the clean cycle, don't try to put it out. Even if the oven has cooled sufficiently for the door to open, doing so will allow oxygen to rush in and fuel the flames. Obviously, if it is fully engulfed, get out of the house and call 911. So, now what? Now that you understand all the pros and cons of using the self-cleaning feature on your oven, you may be wondering what other alternatives might be available to safely removing grease and grime. Consider these options: Manual Cleaning Method Commercial cleaners—these usually come in spray form and can be quite harsh but are very effective at removing debris and grease without extreme temperature or difficult scrubbing. Proper room ventilation and protective gloves will be needed. All-natural cleaners—Eco-friendly products like baking soda, white vinegar, lemon juice, dish soap and cream of tartar can all be used to rid your oven of stubborn food stains without using toxic chemicals. There are several recipes for all-natural cleaning that combine products to produce a paste. Allowing the mixture to sit overnight or bake at low temperature for an hour will loosen grime and easily wipe clean with a damp sponge. New Technologies If you're in the market for a new oven and want to avoid the current self-cleaning options, Whirlpool and Bosch have both introduced their technologies: Whirlpool with Aqua-It!—uses a special coating that activates with water and low-temperature heat to release dirt and debris for easy removal. Bosch with Eco-Clean—includes a ceramic coating on the back wall of the oven (ceiling and side walls can be upgraded) to reduce spills from sticking. Before buying any home appliance, always do your research. Watch and read technology descriptions and reviews, ask questions on local forums or ask local appliance repair experts. Conclusion How you maintain your oven is a personal preference, but keep in mind that a high percentage of service calls are due to failures related to the self-cleaning feature. Always consult your owner's manual for recommendations for using the clean mode on your appliance. Feel confident that FIX Appliances CA will be their appliance installation in Toronto or help problems arise to solve any issue of appliance repair service. Do you have problems with your oven? Our oven repair experts will properly diagnose and fix your oven or stove. Same Day repair service available. For Same-Day service, our local company with its local technicians serving the GTA and southern Ontario. We'll be more than happy to help you. Request stove or oven repair now toll-free: 888-242-0777 Talk to our experts in your city! Any more questions about other makes and models? FIX Appliances CA™ is here for you, even during such times. By appliance repair expert Oleg Ch.
